

Dictionary using a Binary Search Tree

Problem

Submissions

Leaderboard

You are required to implement a basic dictionary using a Binary Search Tree (BST). Each entry in the dictionary consists of a word (key) and its meaning (value). The operations that you need to support are inserting a word, deleting a word, and searching for a word. After all operations are performed, the BST should display the words in lexicographical order. Additionally, for every search operation, you must track whether the word was found (1 for success, 0 for failure).

Input Format

The first line contains an integer N , the number of operations.

For each of the next N lines, an integer specifies the operation to be performed followed by the required parameters:

Insert (1): The integer 1, followed by the word (key) and its meaning (value).

Delete (2): The integer 2, followed by the word to be deleted.

Search (3): The integer 3, followed by the word to be searched.

Constraints

Maximum word length: 25 characters.

Maximum meaning length: 100 characters.

Output Format

Inorder Traversal of the BST: After all operations, print the contents of the dictionary in lexicographical order as word,meaning pairs.

Search Results: Print the result of each search operation as a space-separated number of 1 (if the word was found) or 0 (if not found).

Sample Input 0

```
4
1
apple red fruit
1
black a colour
2
apple
3
black
```

Sample Output 0

```
Inorder Traversal:
black, a colour

Search Results:
1
```

Explanation 0

The program should insert the words "apple" and "black" with their meanings into a binary search tree, deletes "apple," and finally searches for "black," resulting in an inorder traversal that displays "black, a colour" and a search result of 1 indicating success.

Sample Input 1

```
3
1
loud high volume
2
louds
3
loud
```

Sample Output 1

Inorder Traversal:
loud, high volume

Search Results:
1

Explanation 1

The program inserts the word "loud" with its meaning into a binary search tree, deletes the non-existent word "louds," and successfully searches for "loud," resulting in an inorder traversal that shows "loud, high volume" and a search result of 1 indicating success.
